

SITE NUMBER—07144100

SITE NAME—Little Ark near Sedgwick

DATE CREATED—4/10/2013

MODEL DEVELOPMENT DATA PERIOD—7/27/2004 – 09/22/2011

MODEL-CALIBRATION DATA SET—All data were collected using USGS protocols and are stored in NWIS database. The regression model is based on 65 concurrent measurements of total phosphorus (*TP*) and turbidity (*Turb*) samples collected from 07-27-2004 through 09-22-2011. Samples were collected throughout the range of continuously observed hydrologic condition. Summary statistics and complete model-calibration data set are provided. No total phosphorus values were deemed outliers.

MODEL DEVELOPMENT—Regression analysis was done using S-PLUS, R, and a spreadsheet macro which examined turbidity as an explanatory variable for estimating total phosphorus. Different combinations of untransformed and \log_{10} -transformed data were evaluated. Turbidity was selected as the best model on the basis of residual plots, *MSPE*, adjusted R^2 , PRESS and Mallow's C_p . Model spreadsheet is archived and can be found at <http://nrtwq.usgs.gov/ks> for review, and contains all relevant sample data and more in-depth statistical information.

MODEL SUMMARY—Summary of final regression analysis for total phosphorus at site number 07144100.

Turbidity-based model:

$$\log_{10}(TP) = 0.0012 \times \log_{10}(Turb) + 0.5357,$$

where

TP = total phosphorus, in mg/L as P; and

Turb = turbidity, in FNU.

The use of turbidity as an explanatory variable makes sense both physically and statistically. It makes physical sense because nutrients, such as total phosphorus, tend to adhere to particles associated with turbidity. Therefore, total phosphorus is mobilized by the same hydrologic forces that mobilize sediment particles associated with turbidity. Also, total phosphorus is a nutrient that affects organisms in water that reduce penetration of light. This results in a clear correlation between total phosphorus and turbidity. Turbidity makes statistical sense as an explanatory variable because it resulted in a model with low Mallow's C_p and PRESS values, and high adjusted R^2 values.

TOTAL PHOSPHORUS RECORD—The record is computed using the regression model in the NRTWQ website. Data are computed at hourly intervals. The record is complete for the year except as noted. A more in-depth description of the water quality record can be found at –

<http://nrtwq.usgs.gov/ks>

REMARKS—

- Site location, equipment, and other gage information can be found in SIMS.
