

**SITE NUMBER**—07144100

**SITE NAME**—Little Arkansas River near Sedgwick

**DATE CREATED**—4/8/2013

**MODEL DEVELOPMENT DATA PERIOD**—5/1/1998 – 9/22/2011

**MODEL-CALIBRATION DATASET**—All data were collected using U.S. Geological Survey (USGS) protocols and are stored in National Water Information System (NWIS) database. The regression model is based on 160 concurrent measurements of specific conductance and calcium samples collected from 05-01-1998 through 09-22-2011. Samples were collected throughout the range of continuously observed hydrologic and specific conductance conditions. Specific conductance values are time-averaged, approved unit values corresponding with the duration of sample collection. Summary statistics and complete model-calibration dataset are provided. No calcium values were deemed outliers.

**MODEL DEVELOPMENT**—Regression analysis was done using S-PLUS, R, and a spreadsheet macro that examined specific conductance as an explanatory variable for estimating calcium. Different combinations of untransformed and  $\log_{10}$ -transformed data were evaluated. Calcium and specific conductance were selected as the best model based on residual plots, model standard percentage error (*MSPE*), adjusted  $R^2$ , prediction error sum of squares (PRESS), and Mallow's  $C_p$ . Model spreadsheet is archived and can be found at <http://nrtwq.usgs.gov/ks> for review, and contains all relevant sample data and more in-depth statistical information.

**MODEL SUMMARY**—Summary of final regression analysis for calcium concentration at site number 07144100.

Specific conductance-based model:

$$\log_{10}(Ca) = 1.05 \times \log_{10}(SC) - 1.14,$$

where

$Ca$  = calcium, in milligrams per liter; and

$SC$  = specific conductance, in microsiemens per centimeter at 25 degrees Celsius.

The use of specific conductance as an explanatory variable makes sense both physically and statistically. It makes physical sense because calcium is a major ion that affects the conductivity of water. Specific conductance is a measure of the conductivity of water. This results in a clear correlation between calcium and specific conductance. Specific conductance makes statistical sense as an explanatory variable because it resulted in a model with low Mallow's  $C_p$  and PRESS values, and high adjusted  $R^2$  values.

**CALCIUM RECORD**— The record is computed using the regression model in the National Real-Time Water Quality (NRTWQ) website. Data are computed at hourly intervals. The record is complete for the year except as noted. The specific conductance monitor was removed during winter months because of below freezing conditions. A more in-depth description of the water quality record can be found at –

<http://nrtwq.usgs.gov/ks>

**REMARKS**—

- Site location, equipment, and other stream-gaging station information can be found in the Site Information Management System (SIMS).
